Art Unit

1641

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 23 September 2003.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 3,6-16,18-21 and 30-32 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 3,6-16,18-21 and 30-32 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
- Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on _____ is: a) ☐ approved b) ☐ disapproved by the Examiner.
- If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

- 13) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
 - ☐ Certified copies of the priority documents have been received in Application No. _____.
 - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
- * See the attached detailed Office action for a list of the certified copies not received.
- 14) ☒ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).
- a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s) _____.
- 4) ☐ Interview Summary (PTO-413) Paper No(s). _____.
- 5) ☐ Notice of Informal Patent Application (PTO-152)
- 6) ☐ Other: _____.

Art Unit: 1641

DETAILED ACTION

Claim Objections

1. Claims 14 and 18 are objected to because they are duplicates of one another. Applicant is required to cancel the claim(s) or amend the claim(s) to place the claim(s) in proper dependent form.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

3. Claims 15 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

4. Claim 15 is rejected as vague and indefinite for the recitation of a second reference dye because the claim on which it depends (claim 16) does not recite a first reference dye.

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.

Art Unit: 1641

2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

7. This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

8. Claims 3, 6, 10-14, 16, 18-21, and 30-32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Van Ness et al. (US Pat. 5,667,976) in view of Wagner, Jr. (US Pat. 6,114,115).

Van Ness et al. teach solid supports for nucleic acid hybridization assays, wherein nylon coated magnetic beads may be used (abstract and Col. 14). Oligonucleotides are immobilized via covalent attachment onto the beads and serve as probes (abstract and claim 1). The beads may be employed free in solution (abstract). The reference also teaches that the oligonucleotides immobilized on the beads can serve as electrophiles for the covalent attachment of proteins and antibodies. In addition, labels, such as colored labels (dyes), may be used in the hybridization assays. However, the reference does not teach immobilization of proteins.

Wagner, Jr. et al. teach a composition comprising protein immobilized on a solid support or matrix, wherein the solid support may be a nitrocellulose, nylon, or a magnetic bead.

Art Unit: 1641

It would have been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to immobilize proteins on beads as taught by Wagner, Jr. with the composition of Van Ness et al. because Wagner, Jr. teaches that proteins may be immobilized on solid supports, such as magnetic beads. As such, one would have had a reasonable expectation of success in immobilizing proteins instead of oligonucleotides on the magnetic beads of Van Ness et al. It would have also been obvious to one of ordinary skill in the art at the time of the invention to remove the liquid in the modified colloidal suspension of Van Ness et al. and Wagner, Jr. and arrive at a powdered form because powder is well known in the art to have greater stability and shelf life in comparison to a liquid form. In addition, such a form is easier to package in a kit, which provides increased convenience and economy. Also, a powder form may be easily reconstituted, as necessary, prior to use. Further, it would have been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to change the size of the particles to be within the range of the claims as an obvious matter of design choice. Such a modification would have involved a mere change in the size of a component. A change in size is generally recognized as being within the level of ordinary skill in the art. *In re Rose*, 105 USPQ 237 (CCPA 1955). Finally, it would have been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to immobilize molecules to the modified particles Van Ness et al. and Wagner, Jr. via non-covalent or electrostatic binding, as well as adsorption because all are well-known immobilization methods in the art, and one of skill would have had a reasonable expectation of success in using any of these methods to immobilize the molecules onto particles.

9. Claims 3, 6-13, 16, 19-21, 30-32 rejected under 35 U.S.C. 103(a) as being unpatentable over Nagai et al. (US Pat. 5,194,372) in view of Wagner, Jr. (US Pat. 6,114,115).

Nagai et al. teach methods for detecting disorders, wherein fine particles in solution have at least two types of nucleic acid singles stranded probes immobilized thereon. The probes are complementary to first and second regions, respectively, and are exclusive of each other (see claim 1). However, the reference does not teach immobilization of proteins.

Wagner, Jr. et al. teach a composition comprising protein immobilized on a solid support or matrix, wherein the solid support may be a nitrocellulose, nylon, or a magnetic bead.

It would have been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to immobilize proteins on beads as taught by Wagner, Jr. with the composition of Nagai et al. because Wagner, Jr. teaches that proteins may be immobilized on solid supports, such as magnetic particles. As such, one would have had a reasonable expectation of success in immobilizing proteins instead of single strand nucleic acids on the particles of Nagai et al.

It would have also been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to use nitrocellulose, PVF, or nylon as the matrix material, since Wagner, Jr. teaches the immobilization of proteins on these materials, and it has also been held to be within the general skill of a worker in the art to select a known material on the basis of its suitability for the intended use as a matter of obvious design choice. *In re Leshin*, 125 USPQ 416.

Furthermore, it would have been obvious to one of ordinary skill in the art at the time of the invention to remove the liquid in the modified colloidal suspension of Nagai et al. and Wagner, Jr. and arrive at a powdered form because powder is well known in the art to have greater stability and shelf life in comparison to a liquid form. In addition, such a form is easier to package in a kit, which provides increased convenience and economy. Also, a powder form may be easily reconstituted, as necessary, prior to use. Further, it would have been *prima facie*

Art Unit: 1641

obvious to one of ordinary skill in the art at the time of the invention to change the size of the particles to be within the range of the claims as an obvious matter of design choice. Such a modification would have involved a mere change in the size of a component. A change in size is generally recognized as being within the level of ordinary skill in the art. *In re Rose*, 105 USPQ 237 (CCPA 1955). Finally, it would have been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to immobilize molecules to the modified particles Nagai et al. and Wagner, Jr. via non-covalent or electrostatic binding, as well as adsorption because all are well-known immobilization methods in the art, and one of skill would have had a reasonable expectation of success in using any of these methods to immobilize the molecules onto particles.

10. Claims 3, 6-16, 18-21, and 30-32 rejected under 35 U.S.C. 103(a) as being unpatentable over Delair et al. (US Pat. 6,033,853) in view of Wagner, Jr. (US Pat. 6,114,115).

Delair et al. teach a kit for detecting a nucleic acid sequence comprising a labeled nucleotide probe and a reagent consisting essentially of a suspension of insoluble particles on which at least one series of oligonucleotides are immobilized. The kit may be used in hybridization assays (abstract). The size of the particle may range from 50 nm to 5µm (claim 7). The oligonucleotide probes may be immobilized on the particle via covalent binding or adsorption, and the label may be any known in the art, such as colored labels. However, the reference does not teach immobilization of proteins.

Wagner, Jr. et al. teach a composition comprising protein immobilized on a solid support or matrix, wherein the solid support may be a nitrocellulose, nylon, or a magnetic bead.

It would have been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to immobilize proteins on beads as taught by Wagner, Jr. with the composition of

Art Unit: 1641

Delair et al. because Wagner, Jr. teaches that proteins may be immobilized on solid supports, such as magnetic particles. As such, one would have had a reasonable expectation of success in immobilizing proteins instead of oligonucleotides on the particles of Delair et al. It would have also been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to use nitrocellulose, PVF, or nylon as the matrix material, since Wagner, Jr. teaches the immobilization of proteins on these materials, and it has also been held to be within the general skill of a worker in the art to select a known material on the basis of its suitability for the intended use as a matter of obvious design choice. *In re Leshin*, 125 USPQ 416. Furthermore, it would have been obvious to one of ordinary skill in the art at the time of the invention to remove the liquid in the modified colloidal suspension of Delair et al. and Wagner, Jr. and arrive at a powdered form because powder is well known in the art to have greater stability and shelf life in comparison to a liquid form. In addition, such a form is easier to package in a kit, which provides increased convenience and economy. Also, a powder form may be easily reconstituted, as necessary, prior to use. Further, it would have been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to change the size of the particles to be within the range of the claims as an obvious matter of design choice. Such a modification would have involved a mere change in the size of a component. A change in size is generally recognized as being within the level of ordinary skill in the art. *In re Rose*, 105 USPQ 237 (CCPA 1955). Finally, it would have been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to immobilize molecules to the modified particles Delair et al. and Wagner, Jr. via non-covalent or electrostatic binding because both are well-known immobilization methods in

Art Unit: 1641

the art, and one of skill would have had a reasonable expectation of success in using any of these methods to immobilize the molecules onto particles.

11. Claims 3, 6, 10-13, 16, 19-21, 30-32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kawaguchi et al. (US Pat. 5,122,600) in view of Wagner, Jr. (US Pat. 6,114,115).

Kawaguchi et al. teach DNA immobilized microspheres, wherein the particle has a diameter of 0.1-50 μ M. Protein may be adsorbed to the DNA immobilized particles for protein purification. DNA may be attached to the particles via adsorption or covalent attachment. However, the reference does not teach immobilization of proteins.

Wagner, Jr. et al. teach a composition comprising protein immobilized on a solid support or matrix, wherein the solid support may be a nitrocellulose, nylon, or a magnetic bead.

It would have been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to immobilize proteins on beads as taught by Wagner, Jr. with the composition of Kawaguchi et al. because Wagner, Jr. teaches that proteins may be immobilized on solid supports, such as magnetic particles. As such, one would have had a reasonable expectation of success in immobilizing proteins instead of DNA on the particles of Kawaguchi et al. It would have also been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to use nitrocellulose, PVF, or nylon as the matrix material, since Wagner, Jr. teaches the immobilization of proteins on these materials, and it has also been held to be within the general skill of a worker in the art to select a known material on the basis of its suitability for the intended use as a matter of obvious design choice. *In re Leshin*, 125 USPQ 416. Furthermore, it would have been obvious to one of ordinary skill in the art at the time of the invention to remove

Art Unit: 1641

the liquid in the modified colloidal suspension of Kawaguchi et al. and Wagner, Jr. and arrive at a powdered form because powder is well known in the art to have greater stability and shelf life in comparison to a liquid form. In addition, such a form is easier to package in a kit, which provides increased convenience and economy. Also, a powder form may be easily reconstituted, as necessary, prior to use. Further, it would have been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to change the size of the particles to be within the range of the claims as an obvious matter of design choice. Such a modification would have involved a mere change in the size of a component. A change in size is generally recognized as being within the level of ordinary skill in the art. *In re Rose*, 105 USPQ 237 (CCPA 1955). Finally, it would have been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to immobilize molecules to the modified particles Kawaguchi et al. and Wagner, Jr. via non-covalent binding because it is a well-known immobilization method in the art, and one of skill would have had a reasonable expectation of success in using such a methods to immobilize the molecules onto particles.

12. Claims 3, 6-16, 18-21, and 30-32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Seul (WO 97/40385).

The reference teaches the manipulation of colloidal particles, wherein the particles may be 1 or 10 microns in diameter (page 55). A plurality of types of molecules may be attached to the surfaces of the particles, wherein each particle has a plurality if particle of one type (page 58). The molecules may be oligonucleotides or protein. The particle or beads may also be labeled by any known conventional label, including colored labels. However, the reference does not teach specific matrix materials, a powder form, or specific immobilization techniques.

Art Unit: 1641

It would have been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to use nitrocellulose, PVF, or nylon as the matrix material, since it has been held to be within the general skill of a worker in the art to select a known material on the basis of its suitability for the intended use as a matter of obvious design choice. *In re Leshin*, 125 USPQ 416. Furthermore, it would have been obvious to one of ordinary skill in the art at the time of the invention to remove the liquid in the colloidal suspension of Seul et al. and arrive at a powdered form because powder is well known in the art to have greater stability and shelf life in comparison to a liquid form. In addition, such a form is easier to package in a kit, which provides increased convenience and economy. Also, a powder form may be easily reconstituted, as necessary, prior to use. Finally, it would have been *prima facie* obvious to one of ordinary skill in the art at the time of the invention to immobilize molecules to the particles of Seul et al. via covalent, non-covalent, electrostatic, or adsorptive techniques because all are well known immobilization methods in the art, and one of skill would have had a reasonable expectation of success in using any of these methods to immobilize the molecules onto particles.

Response to Arguments

13. Applicant's arguments with respect to claims 3, 6-16, 18-21 and 30-32 have been considered but are moot in view of the new ground(s) of rejection. Specifically, applicant argues that the references fail to disclose specific matrix materials or the immobilization of proteins or oligopeptides, but these deficiencies have been remedied through the application of the references under 35 USC 103, either alone or in combination with Wagner, Jr., rather than under 35 USC 102.

Art Unit: 1641

Conclusion

Claims 3, 6-16, 18-21 and 30-32 are rejected.

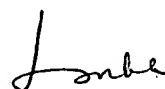

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kartic Padmanabhan whose telephone number is 703-305-0509.

The examiner can normally be reached on M-F (8:30-5:00).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Long Le can be reached on 703-305-3399. The fax phone number for the organization where this application or proceeding is assigned is (703) 872-9306.

Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the receptionist whose telephone number is 703-308-0196.
